

In short:

- COVID vaccines do not prevent you from getting sick with COVID, passing COVID to others, or dying from COVID.
- COVID shots are toxic, with more injuries reported from the COVID vaccines in their short deployment than all other vaccines over 30 years, combined, according to vaccine safety databases.
- The COVID shots are experimental gene therapies, approved for use under emergency use authorization, not traditional vaccines. They have barely been tested, especially in children.
- We don't know what the COVID shots do to the body over time.
- Kids are mostly immune to COVID, and 99.995% recover easily if infected.
- While other countries and some US states are recommending against giving shots to healthy young people, Virginia's Department of Health is fast-tracking regulatory action to consider adding them to the required childhood schedule of immunizations.
- The CDC and FDA recommend the shots but do not tell the public about the catastrophic levels of vaccine injuries and deaths being reported.
- In older persons there is evidence of cancer and loss of fertility after COVID vaccination
- Risks of COVID vaccination clearly outweigh benefits in young and healthy people.
- No studies exist that prove COVID vaccines are safe in the long term.
- Requiring vaccination without providing accurate and complete information about risks, benefits and alternative options violates the Nuremberg Code, parental rights, and the fundamental human right of bodily autonomy.
- Use or threat of coercion, retaliation, or social restriction to promote or achieve vaccination violates the Nuremberg Code.

Longer:

- The COVID shots are not traditional vaccines, but experimental genetic products with novel mechanisms of action and many unknown short- and especially long-term risks.
- The CDC and FDA did not determine the long-term safety of the current COVID shots in children before instituting current child vaccine policies.
- After just one year of use in children, the U.S. Vaccine Adverse Events Reporting System (VAERS) contains almost 28,000 adverse event reports in American children, with 64 deaths and 433 near-deaths, 308 permanently disabled, and 1,044 reports of myocarditis.
- Other serious injuries in children include severe allergic reactions, blood clots and strokes, encephalitis/encephalopathy, and other autoimmune and neurologic disorders.

- Healthy children under 18 have virtually no risk of death from COVID, a 99.995% recovery rate, and most have minimal symptoms.
- CDC data show that more than three out of four children already have developed natural immunity to the virus and thus have no demonstrated need for vaccination.
- There is no benefit to vaccinating children given their low risk from COVID and the serious health risks of the shot that parents and children may have to live with for the rest of their lives.
- The CDC and FDA have promoted the false and misleading claims that “COVID vaccines are safe and effective” and “benefits of vaccination outweigh the risks” but have failed to provide objective quantitative evidence that supports their scientific basis.
- Government agencies have not told the American public about the alarming numbers of injuries and deaths reported to official U.S. vaccine safety tracking databases and in pharmaceutical companies’ own clinical trial data.
- Virginia’s Department of Health is fast-tracking regulatory action plus a review of all the regulations covering the Schedule of Required Immunizations for School Children, which may enable the COVID “vaccine” to be added to the schedule of required immunizations.
- Parents who do not let their kids be injected with an experimental gene therapy could face severe penalties under Virginia law if the shots are added to the schedule of required immunizations, including heavy fines, jail time, and misdemeanor charges for noncompliance.
- On Oct 20, 2022, the Advisory Committee on Immunization Practices (ACIP) approved adding the C-19 shot to the CDC’s Child and Adolescent Immunization Schedule. The Virginia Department of Health (VDH) generally adopts what the CDC approves as “evidence-based, routinely recommended vaccinations.”
 - CDC approval of the shots as “safe and effective” was *not* “evidence-based.”
 - The COVID shots are *not* “routinely recommended.”
- The COVID shot is not a traditional vaccine and is inadequately tested, particularly in children.
- Parents’ personal health decisions to accept or reject the vaccine for their minor children were made without their true voluntary informed consent due to intentional failure to provide complete and accurate information about risks, benefits and alternative options and, in numerous instances, coercion, retaliation or social restrictions. This violates the Nuremberg Code, parental rights and the fundamental human right of bodily autonomy.

VAMFA’s mission is to *Educate, Engage, Protect* Americans’ God-given rights, and *Defend and Restore* Constitutional restraints on the government of our republic.
